Electro Hydro-Mount

The electronic hydro-mount represents an innovative and enhanced version of the conventional hydraulic mounts. This type of hydraulic mounts is controlled by the vehicle ECU, through an actuator, the mount's dampening capacity can be altered depending on the vibration caused by the engine.

Whether the car is at idle or full throttle, the electronically controlled hydraulic mount is capable of better isolation performance, providing a smoother driving experience.

In addition to the conventional hydraulic mounts, the electro hydro mounts perform more smoothly at high frequency vibrations as well as low ones. Their damping capacity covers way more wider range of vibrations thanks to their ability to switch from a soft to a rigid mode depending on the motion.
